

Rolling Averages of ZC Detections alongside Soundscape Metrics - Buoy 10

Rolling Averages of PM Detections alongside Soundscape Metrics - Buoy 10

TOL125 and 2000 don't mimic each other.

ZC detections around 9-27 when sound levels drop.

No PM when sound levels are highest. PM present as sound levels start to increase.

TOL 125 and 2000 do not mimic each other here. PM present when sound levels begin to drop.

Rolling Averages of ZC Detections alongside Soundscape Metrics - Buoy 12

Rolling Averages of PM Detections alongside Soundscape Metrics - Buoy 12

More PM present when TOL2000 is low.

Rolling Averages of ZC Detections alongside Soundscape Metrics - Buoy 13

Rolling Averages of PM Detections alongside Soundscape Metrics - Buoy 13

ZC present when TOL levels are dropping.

PM present when 2000 levels are low.

ZC generally present as sound levels dropping.

ZC detection peaks when TOL125 peaks (odd). PM present as 2000 is increasing.

Rolling Averages of ZC Detections alongside Soundscape Metrics - Buoy 19

Rolling Averages of PM Detections alongside Soundscape Metrics - Buoy 19

Whale peaks mildly coincide with sound level peaks (odd).

Rolling Averages of ZC Detections alongside Soundscape Metrics - Buoy 20

Rolling Averages of PM Detections alongside Soundscape Metrics - Buoy 20

ZC present when TOL levels decreasing. PM peaks when 125 is lower, but 2000 is higher.

ZC lowest when sound levels are highest.

Both whale presence increase as sound levels increase.
